## How to Handle a 37,000 Pound Vibration Problem

### Customer Profile:

**Industry type:** Engineering, Procurement, construction, maintenance and shutdown services

**Company name:** Transfield Worley, Inc.

New Zealand based Transfield Worley engineering and construction company recently approached [Kellett Enterprises](#) with a heavy vibration problem, really heavy. But like all of Kellett's customers over the years, they soon found out no vibration challenge is too big ..... or too heavy for the LP-13 Shake Absorber® Vibration Isolation Pad.

Transfield Worley offers a range of engineering and construction services, so they're used to big challenges. When they found out the Kellett team is a pro at tackling challenges, they knew who to call.

The company's project team leaders needed to resolve the vibration and noise issues in six, 37,000-pound HSE containers that were being engineered and constructed as offices, locker rooms, accommodation units and even a health facility. The generators below the floor of the containers caused significant noise and vibration issues that needed to be resolved

And that's where they needed Kellett's support - to research and identify the right size, quantity and thickness to place under the feet of all those containers.

Kellett's team gathered its clues from the customer and recommended the LP-13 Shake Absorber® Vibration Isolation Pad.

The pads were custom cut and shipped to New Zealand by the client's tight deadline.
